graas

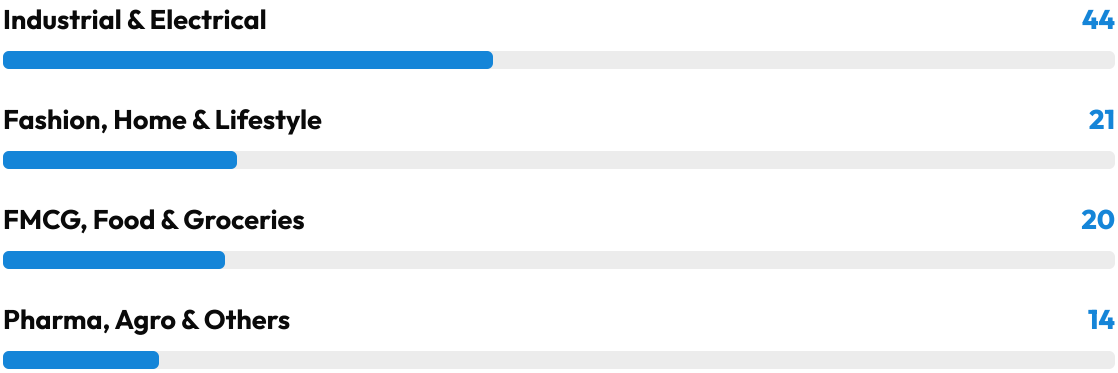

GROWTH AS A SERVICE

THE GRAAS RETAIL AI INDEX

Measuring AI readiness across Retail Commerce enterprises

WHO WE SPOKE TO

100 enterprise conversations across India and Southeast Asia, with enterprise revenues of US$200M+, conducted in Q2 2026.

INSIGHT 01

Everyone is evaluating. Few are live.

Bot deployed in 2025

1/100

Actively evaluating AI in 2026

36/100

AI agent live in 2026

7/100

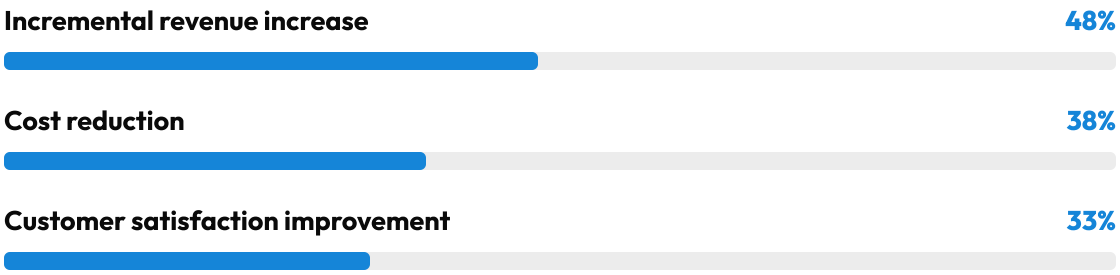

1/100 is using AI for ordering today.

Sevenfold growth in a year, yet only seven of the 36 actively evaluating AI have reached production.

Support remains the dominant starting point; ordering and other revenue-generating use cases are still early.

INSIGHT 02

What CXOs want AI to accomplish

CXO includes CEO, CIO, CTO, CMO, CSO and Heads of Digital Transformation / Innovation.

INSIGHT 03

Voice is the #1 ask

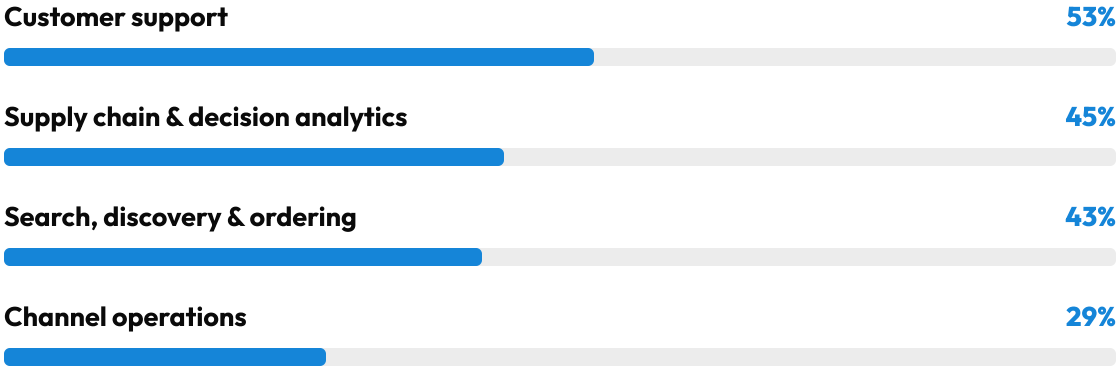

31/100
Evaluating voice-to-voice agents

4/100
Have live deployments

The appetite for voice is clear, but robust evaluation for agent misbehaviour remains an emerging capability.

INSIGHT 04

Where enterprises want AI to help

Demand is moving beyond support, into decisions, customer interactions and revenue-generating workflows across the enterprise.

INSIGHT 05

In their own words

> *"I worry about agent hallucination around my product range and warranty."*

> *"The agent does not know my pricing."*

> *"The agent cannot bring a human into the conversation when required."*

> *"The agent is unaware of my inventory in the warehouse."*

Four different concerns, one cause: the agent doesn't have the Context it needs to act. The answers already sit across ERP, DMS, SFA, dealer apps, CRM and WMS, but only **3/100** enterprises have a Context layer connecting them.

The stack exists.
Context does not.

Across 100 enterprise conversations, the constraint is rarely the absence of data. The systems already hold the facts: price, stock, credit, product, customer and transaction data. What's missing is the **Context** that connects them.

At Graas, we call this the Commerce Knowledge Graph: the layer that connects enterprise systems and gives AI agents the context they need to reason and act.

The next wave of enterprise AI won't be defined by models alone. It will be defined by the Context those models can access.
